- Heading calibration
- GPS Health check

Parker Attitude Control Heading Calibration and GPS Health Check

Parker Heading Calibration

Parker Maritime AS is using a GPS / Glonass based heading and pitch system to check the heading devices on vessels. In combination with a special in-house developed software we offer an efficient way of checking the heading devices. The system is easy to deploy and works independently of onshore reference points.

Parker Maritime AS also offers a vessel GPS “health-check”.

Windmill Installation

Vessel Survey

Survey of reference points and sensors

Parker Maritime can establish a complete set of reference points, so called fix-points, onboard a vessel as well as survey all sensors into this coordinate system. This way all sensors onboard will refer to the same coordinate system and ease the use of them. All measured points are transformed into the vessel axis system and reference plane.

A high precision total station is used, and in some cases together with photogrammetry equipment.

The points are frequently used for Roll and Pitch survey control, DGPS antenna health checking and verifying of the vertical reference system onboard.
